AxiomEHR Honors

Recognized for IT Solutions Innovation

We're proud to represent the best of innovation in Southern Arizona, as a finalist for the **IT Solutions Innovation Award** from the Tucson Metro Chamber's annual [Copper Cactus Awards](#).

The honor comes as a result of our work developing AxiomEHR, a new breed of EHR that is fully configurable and customizable. Tailored specifically for behavioral and integrated health care providers, **AxiomEHR features a unique AI-powered architecture** that supports data-based decision-making and flexible care coordination. It's an innovative approach that eliminates the considerable pain that has plagued EHR users for years.

AxiomEHR exemplifies tech innovation for integrated health care providers. See Why →

New Case Study

Service Access & Management Focuses on Data-Driven Decisions

EHR systems should be a source of excellence rather than disappointment. But many behavioral health care providers don't want to change their EHR software out of fear that the result will be a less than optimal transformation – even though it's no longer meeting their needs.

We believe it helps to **consider an EHR implementation as change management**. In other words, a great EHR experience relies on people as much as the technology.

Our new white paper explores the comprehensive approach to successful EHR implementation, emphasizing change management that integrates goals, planning, people, processes, and technology.

EHR implementation best practices drive excellence. Learn How →

Blog Series

EHR Productivity

What if you could enhance your organization's productivity, from bottom to top, without making people work harder?

Each AxiomEHR implementation has been designed to leverage behavioral health care providers' own data, ensuring the accuracy of the results generated by the AI-powered system. More importantly, all data is verified by the clinician before being saved to the patient record – a process that takes 5 minutes instead of the traditional 2 hours. Through a series of new blog posts, we explore three ways **AxiomEHR increases productivity** – while improving patient outcomes and reducing clinician burnout: [automating workflows](#), [reducing no-shows](#), and [enabling patient avatars](#).
